## SCENERY INSTALLATION

Unlike the previous version of the scenery, there is now an option to install the scenery without modifying FGData. You will only have to install the HK-CustomScenery folder as you would install a normal scenery. This is done by adding the folder via the launcher, in the addons menu.

## MATERIALS INSTALLATION

In order to use the custom terrain textures supplied with this scenery package, installation of regional materials and textures are required. This is not recommended, as it affects performance and modifications to FGData are required. The materials are installed in data/Materials/regions, and the textures are installed in data/Textures. Make sure to keep the file structure, and always create backup copies before replacing.

## PERFORMANCE

You can still use the scenery if you do not have the best machine. Here are some options to increase performance on slower computers.

1. Turn down your level of detail ranges. Higher LOD ranges make the scenery look stunning, but it affects performance. Settings can be found in view in the menu bar.
  2. Use default terrain textures instead of custom. This was also mentioned earlier.
  3. Fly without custom buildings. In HK-CustomScenery/Models, you will find a folder called “Kowloon” in Airport-VHXX. Removing this will remove all hand-placed buildings throughout the city.
